Executive Summary

Structuring the SeniorFullStack skill as a Claude-native file/folder hierarchy packages 15+ years of monolithic Django + React/TS expertise for automated codebase analysis and production-ready scaffolding. Critical necessities are SKILL.md manifest, templated reference structures, domain knowledge files, and validation scripts to guarantee consistent, battle-tested end-to-end architectures without context overload.

Chain-of-Thought Reasoning

1. **Background**: Early LLM tool-calling used flat JSON; complex full-stack tasks (codebase analysis, monolith scaffolding) demanded reusable, hierarchical packaging—mirroring software engineering patterns formalized in Anthropic's October 2025 Skills release.
2. **Current state**: Claude Skills (2026) place each skill in `.claude/skills/senior-fullstack/` with SKILL.md for auto-discovery; Kimi uses file/folder uploads for agent context; both enable SeniorFullStack to ingest attached documents and emit production hierarchies for Django backend + React/TS frontend monoliths.
3. **Innovations**: Progressive disclosure loads only YAML metadata initially, then instructions/references on trigger; subfolder composition routes analysis to specialized templates/scripts; hot-reload and capability matching allow meta-agents to compose full-stack workflows dynamically.
4. **Implications**: Delivers enterprise-grade consistency and reusability across sessions while adding minimal latency; introduces governance needs for template integrity and output validation.

Technical Deep-Dive

Root: `.claude/skills/senior-fullstack/` (kebab-case).

- `SKILL.md` : YAML frontmatter (`name` , `description` , `version` , `capabilities: [codebase_analysis, hierarchy_generation, security_review, monolith_scaffolding]`) + markdown instructions for file ingestion, architecture scoring, and Django/React/TS output.
- `references/` : django_best_practices.md, react_ts_patterns.md, integration_patterns.md, owasp_django.md.

- `assets/templates/` : django_monolith/ (apps/, core/, services/, settings/, urls/), react_frontend/ (feature-based TS structure with Vite + routing).
- `scripts/` : analyze.py (Pydantic-validated codebase parser), generate_hierarchy.py (outputs production folder tree + boilerplate).
- `checklists/` : production_readiness.md, performance_scaling.md.

  Mechanisms: Claude loads metadata always, pulls subfolders on-demand (progressive disclosure <5k tokens), executes scripts sandboxed, and returns validated file/folder tree with rationale.

CIA Triad Evaluation

- **Confidentiality**: Uploaded codebases risk leakage via skill outputs. Risks: proprietary logic exposure. Mitigations: read-only mounts, no-log metadata stripping, explicit capability tokens.
- **Integrity**: Tampered templates or injected prompts corrupt generated hierarchies. Risks: insecure Django settings or vulnerable React patterns. Mitigations: SHA256 signing of references/, runtime checklist enforcement, immutable Git-backed skill snapshots.
- **Availability**: Deep reference graphs or unoptimized scripts cause timeouts. Risks: large monolith analysis exhaustion. Mitigations: max-depth limits, lazy loading + LRU cache, fallback generic templates, per-skill resource quotas.

Validation & Assurance

Cross-verified against Anthropic “The Complete Guide to Building Skills for Claude” (Jan 2026) and official skills repository; Kimi agent file handling confirmed via Moonshot K2.6 docs. Existing community Django/React skills validate pattern applicability. Confidence: 88/100. Uncertainty: exact Kimi skill subfolder depth remains partially proprietary.

Actionable Recommendations & Future Outlook

- Use kebab-case folder + exact SKILL.md naming; enforce YAML schema validation on install.
- Embed OWASP/Django security checklists and automated test generators in scripts/.
- Register skill in project `.claude/skills/` for team sharing and version pinning.

- Future: auto-refactoring meta-skills and decentralized skill marketplaces with cryptographic provenance. Prioritize template signing and output sandboxing.

Analysis Complete | Confidence: 88/100
